Research profile

Research scientist and technical leader with extensive experience in reinforcement learning and robotics. Develops humanoid learning systems that connect reinforcement learning, visuomotor control, human data, and generative models. Research spans foundational algorithms, data collection and generation, large-scale training, and real-robot evaluation. Record includes 47 accepted or published conference/journal papers, nine oral/highlight/spotlight selections, a *CoRL Best Paper Award Finalist* distinction, and a *SIGGRAPH Best Paper Honorable Mention*.

Selected robotics research contributions

Scalable reinforcement learning and whole-body control

Co-first author of SONIC (*Science Robotics*, 2026): scaled motion tracking using 100M+ motion frames, with a shared control interface for teleoperation and vision-language-action models. SONIC is widely adopted by robotics companies and researchers. Extensive experience with System 1 and System 0 UMI policy training and whole-body teleoperation.

Learning robot skills from human video and world models

Project lead for GRAIL (CoRL 2026 *Oral; Best Paper Award Finalist*), using video foundation models in fully specified 3D scenes to generate 20K+ humanoid demonstrations. Egocentric RGB policies trained solely on GRAIL-generated data achieved 84% pick-up success on seen objects, 80% on unseen objects, and 90% stair-climbing success on a real Unitree G1. Main mentor for Vid2Player3D (SIGGRAPH 2023 *Best Paper Honorable Mention*), which learns physics-based tennis control from broadcast videos.

Visuomotor learning and sim-to-real transfer

Contributed to VIRAL (CVPR 2026), scaling visual teacher-student training and demonstrating 54 continuous zero-shot loco-manipulation cycles on a physical Unitree G1. Related visual RL research studies active perception and dexterity in simulated humanoids. First-author work (ECCV 2018; ICCV 2019) connected egocentric vision to physics-based humanoid control through imitation learning and RL. Experience training GR00T N2 and diffusion policies.

Generative motion and 3D foundations

Main model architect for Kimodo, a controllable motion diffusion model trained on 700 hours of motion capture. First author of PhysDiff (ICCV 2023 *Oral*) and last author of GEM (formerly GENMO) (ICCV 2025 Highlight). Co-first author of GAvatar; additional 3D generation work includes AGG and AdaHuman.
